

A1 — Alternative design: notifications by subscription, not by push

Same boundary, same three connection points. The one decision changed: **the decision moves from write time to read time**. A message is appended once; a user's notifications are **derived** from their standing rules instead of written into a per-user inbox. Components are labelled by responsibility (not implemented).

1 · What I changed

[your words — the one decision you made differently, and why]

2 · Which quality it improves

[your words — name the quality and say what gets easier]

3 · What it costs

[your words — what gets harder or worse]

Legend

→ data flow, labelled
bold changed from the as-built
grey box outside the boundary
① ② ③ where change 1 (snooze), 2 (scheduled) and 3 (digest) would land — draft, check it
