

A1 — As-built design: the notification system

Team Chat (Node, zero dependencies). Arrows show **data flow**, labelled with what crosses them. Every component carries its module and line. Grey boxes are outside the notification boundary.

1 · A mute cannot reach the inbox gate

The only test for whether a message becomes a notification is `inbox = kind !== 'activity'`. muted is read one line earlier but appears nowhere in that expression, so a DM or an @mention is structurally unsuppressable — not by a special case, but by an absence.

Evidence: notifications.js:108 vs :114; the flag is used only at :129–130.

2 · Unread is computed, not notified

`unreadFor()` walks back from a read cursor on demand; no counter is written when a message arrives. `deliver()` calls it for every recipient with no reference to the decision, so muting silences alerts and never hides activity.

Evidence: store.js:449; called unconditionally at routes.js:271.

3 · Two stages, failing in different directions

Stage 1 decides existence (`inbox`) from `kind` alone. Stage 2 decides loudness (`alert`) and is the only thing quiet hours touch — so quiet hours can silence a notification but never delete one.

Evidence: notifications.js:114 vs :120 and :127.
